

| Day 1       |                                                                    |               |                                                                                             |
|-------------|--------------------------------------------------------------------|---------------|---------------------------------------------------------------------------------------------|
| Time        | Schedule                                                           | Speaker       | Title                                                                                       |
| 8:30-9:00   | Opening + Registration                                             |               |                                                                                             |
| 9:00-9:40   | Keynote Lecture                                                    | Regazzoni     | Challenges and advances in multiphysics coupling, with applications in cardiac modeling     |
| 9:40-11:20  | Thematic Session: "Models and Methods for Healthcare Applications" | Cusumano      | Calibration of a Mathematical Model for Cardiac Perfusion                                   |
|             |                                                                    | Dalmaso       | An integrated 1D-0D model of the cardiorespiratory system with local autoregulation         |
|             |                                                                    | Fiori         | Region-Constrained RBPF for MEG source localisation                                         |
|             |                                                                    | Leimer Saglio | A p-adaptive high-order polytopal method for modelling neuronal electrophysiology           |
|             |                                                                    | Trombini      | Stochastic algorithm for the 3D Computed Tomography (CT) problems                           |
| 11:20-11:50 | Coffee Break                                                       |               |                                                                                             |
| 11:50-12:30 | Keynote Lecture                                                    | Montardini    | Low-rank methods in Isogeometric Analysis                                                   |
| 12:30-13:10 | Talks                                                              | Gonnella      | Dynamical Reduced Order Approximation of Wasserstein Gradient Flows                         |
|             |                                                                    | Tarantino     | CAuSe-AI: Evaluating the Reasoning of Deep Learning Models                                  |
| 13:10-14:30 | Lunch                                                              |               |                                                                                             |
| 14:30-15:50 | Talks                                                              | Accogli       | Modeling and simulation of multi-agent systems with stochastic and target-oriented dynamics |
|             |                                                                    | Belardo       | Optimal Convergence in Least-Squares Isogeometric Collocation                               |
|             |                                                                    | Lonati        | Poroelasticity for intrinsically incompressible constituents                                |
|             |                                                                    | Monforte      | TMATDG: applying TDG methods to multiple scattering via T-matrix approximation              |
| 16:00-17:00 | Elevator Pitch                                                     |               |                                                                                             |
| 17:00-18:30 | Poster + Aperitif                                                  |               |                                                                                             |

| Day 2       |                                                             |                 |                                                                                                                 |
|-------------|-------------------------------------------------------------|-----------------|-----------------------------------------------------------------------------------------------------------------|
| Time        | Schedule                                                    | Speaker         | Title                                                                                                           |
| 8:30-9:00   | Opening + Registration                                      |                 |                                                                                                                 |
| 9:00-9:40   | Keynote Lecture                                             | Calatroni       | Optimisation-driven deep learning for image reconstruction                                                      |
| 9:40-11:20  | Thematic Session: "Advances in Scientific Machine Learning" | Daniele         | Deep Equilibrium models for Poisson Inverse Problems via Mirror Descent                                         |
|             |                                                             | Palummo         | Fast physics-informed spatio-temporal smoothing with time-indexed elliptic operators                            |
|             |                                                             | Tomada          | Latent Dynamics Graph Convolutional Networks for model order reduction of parameterized time-dependent PDEs     |
|             |                                                             | Tomasetto       | Sparse sensing is all you need: real-time simulation and optimal control of high-dimensional parametric systems |
|             |                                                             | Valentino       | PINNs and ROMs for predictive maintenance of cultural heritage                                                  |
| 11:20-11:50 | Coffee Break                                                |                 |                                                                                                                 |
| 11:50-12:30 | Keynote Lecture                                             | Torlo           | How to Preserve Moving Equilibria for Hyperbolic Balance Laws with the Global Flux Quadrature                   |
| 12:30-13:10 | Talks                                                       | Labarrière      | On the Role of Overparameterization in Optimization Dynamics                                                    |
|             |                                                             | Scarlato        | A Preconditioned Version of a Nested Primal-Dual Algorithm for Image Deblurring                                 |
| 13:10-14:30 | Lunch                                                       |                 |                                                                                                                 |
| 14:30-15:30 | Talks                                                       | Loffredo Senesi | An entropic lattice boltzmann method for wettability control via coupled boundary-force interpolation.          |
|             |                                                             | Mugnaioni       | Preconditioning techniques for fictitious domain formulations of elliptic interface problems                    |
|             |                                                             | Speroni         | From multi-physics topology optimization to 3D-printed porous scaffolds for soilless cultivation                |
| 15:30-16:00 | SIAM Chapters Round Table                                   |                 |                                                                                                                 |
| 16:00-16:40 | Keynote Lecture                                             | Pagliantini     | Dynamical approximation and sensor placement for the state estimation of conservative dynamics                  |
| 16:40-16:50 | Closing                                                     |                 |                                                                                                                 |
